CHAPTER 7

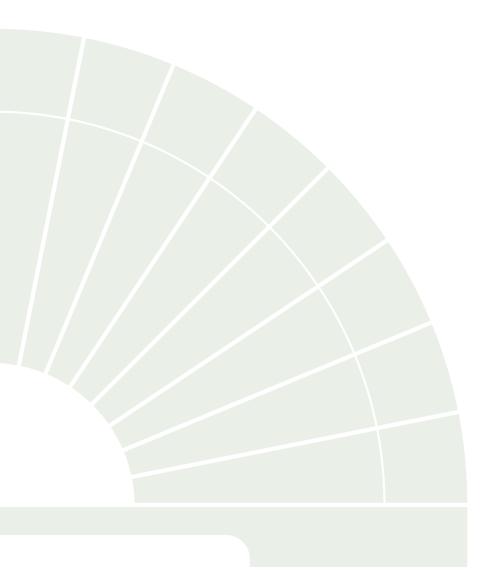

School Contexts for Learning and Instruction

7

Chapter 7 presents findings about the school contexts for learning and instruction in mathematics, including school characteristics, policies, and practices.

Information is presented about the extent of school resources in each country, including computers and Internet access. Data also are provided about the role of the school principal and issues related to school climate and environment, including attendance problems and school safety.

What School Resources Are Available to Support Mathematics Learning?

Some school resources are specific to mathematics, but many are general resources that improve learning opportunities across the curriculum. All the available resources, however, can work together to support mathematics learning and instruction.

To measure the extent of school resources in each of the participating countries, TIMSS created an index of availability of school resources for mathematics instruction (ASRMI). As described in Exhibit 7.1, the index is based on schools' average response to five questions about shortages that affect general capacity to provide instruction and five questions about shortages that affect mathematics instruction in particular. Students were placed in the high category if principals reported that shortages, both general and for mathematics in particular, had no or little effect on instructional capacity. The medium level indicates that one type of shortage affects instruction some or a lot, and the low level that both shortages affect it some or a lot.

Students in schools that reported being well resourced generally had higher average mathematics achievement than those in schools where across-the-board shortages affect instructional capacity some or a lot. For example, in Australia, 33 percent of the students were in the high category with average mathematics achievement of 538, compared with eight percent in the low category with an average of 509. In very few countries – Belgium (Flemish), Singapore, and the Czech Republic –were the majority of students in the high category. On average internationally, only 19 percent of the students were at the high level, and 63 percent at the medium level. It is interesting to note that in high-performing Hong Kong, Chinese Taipei, and Korea, fewer than one-fourth of the students were in schools with a high level of resources.

Exhibit R4.1 in the reference section shows the results for each of the types of facilities and materials summarized in the general capacity part of the index. There was substantial variation across countries, but internationally on average, nearly half the students were in schools where instruction was negatively affected by shortages or inadequacies in instructional materials, budget for supplies, school buildings, and instructional space.

Exhibit R4.2, also in the reference section, shows the results for each of the types of equipment and materials summarized in the mathematics instructional capacity part of the index. More than half of the students, on average internationally, were in schools where shortages or inadequa-

cies in computers and computer software affected the capacity to provide mathematics instruction. Half the students were in schools where the lack of audio-visual resources affected instruction, and 46 percent were in schools needing more library materials relevant to mathematics instruction. Only about one-third of the students, however, were in schools needing more calculators.

R4.3-R4.4

Exhibits R4.3 and R4.4 in the reference section present more data on access to computers and the Internet for instructional purposes. Countries seem to have computers either in nearly all of their schools or in only a fraction of them. Internationally on average, 60 percent of the students were in schools with a student to computer ratio of less than 15 to one, and 25 percent were in schools having no computers. Forty-one percent of the students, on average across countries, attended schools with access to the World Wide Web, and another 29 percent were in schools planning to have access to the Internet by 2001.

7.2

230

Exhibit 7.2 presents trends in the index of availability of school resources for mathematics instruction. There was little or no change between 1995 and 1999 in the percentages of students in schools with low and medium levels of resources. There was a small but significant increase, internationally on average, in the percentage of students in the high category. The Czech Republic, Hungary, Italy, New Zealand, and the United States had increased percentages of students at the high level of the index.

Exhibits 7.1 and 7.2 Overleaf

Index of Availability of School Resources for Mathematics Instruction

Index based on schools' average response to five questions about shortages that affect general capacity to provide instruction (instructional materials; budget for supplies; school buildings and grounds; heating/cooling and lighting systems; instructional space), and the average response to five questions about shortages that affect mathematics instruction (computers; computer software; calculators; library materials; audio-visual resources) (see reference exhibits R4.1–R4.2). High level indicates that both shortages, on average, affect instructional capacity none or a little. Medium level indicates that one shortage affects instructional capacity none or a little and the other shortage affects instructional capacity some or a lot. Low level indicates that both shortages affect instructional capacity some or a lot.

▲ 1999 significantly higher than 1995

No significant difference between 1995 and 1999

▼ 1999 significantly lower than 1995

Significance tests adjusted for multiple comparisons

Background data provided by schools.

234

Trend notes: Because coverage fell below 65% in 1995 and 1999, Latvia is annotated LSS for Latvian-Speaking Schools only. Lithuania tested later in 1999 than in 1995, at the beginning of the next school year. In 1995, Italy and Israel were unable to cover their International Desired Population; 1999 data are based on their comparable populations. Background data for Bulgaria and South Africa are unavailable for 1995.

 Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

A dash (-) indicates data are not available.

An "r" indicates school response data available for 70-84% of students, based on the lower response rate in either 1995 or 1999. An "s" indicates school response data available for 50-69% of students, based on the lower response rate in either 1995 or 1999.

 $^{^{\}dagger}$ $\,$ Countries with unapproved sampling procedures at the classroom level in 1995.

[§] International average is for countries that participated and met sampling guidelines in both 1995 and 1999.

What Is the Role of the School Principal?

To better understand the roles and responsibilities of schools across countries, TIMSS asked school principals how much time per month they spend on various school-related activities. More specifically, they were asked how much time they spend on instructional leadership activities, including discussing educational objectives with teachers, initiating curriculum revisions and planning, training teachers, and engaging in professional development activities. They were asked how much time they spend per month talking with parents, counseling and disciplining students, and responding to requests from local, regional, or national education officials. They also responded to questions about how much time they spend carrying out administrative duties, including hiring teachers, representing the school in the community and at official meetings, and doing internal tasks (e.g., regulations, school budget, and timetable). Finally, they were asked how much time they spend teaching. The results presented in Exhibit 7.3 show that principals reported spending, internationally on average, 51 hours per month on administrative duties, 35 hours per month communicating with various constituents, 33 hours per month on instructional leadership activities, and 16 hours per month teaching.¹

Countries where principals reported spending an average of at least 75 hours per month on administrative duties included Australia, Chinese Taipei, Hong Kong, and New Zealand. Principals reported spending at least 50 hours per month communicating with various groups in Australia, Canada, and the United States. Principals in 10 countries reported spending at least 40 hours per month on instructional leadership activities, and in eight countries they reported that teaching duties (including preparation) occupied at least 30 hours per month.

It is noteworthy that a number of countries, such as Australia, Canada, Chinese Taipei, Hong Kong, New Zealand, Singapore, Thailand, and the United States, have similar patterns in principals' use of time. For example, unlike in most European countries, principals in these countries spend relatively little time teaching, and most of it on administrative duties, communicating with constituents, and engaging in instructional leadership activities.

¹ Activities reported by principals are not necessarily exclusive; principals may have reported engaging in more than one activity at the same time.

236

What Are the Schools' Expectations of Parents?

The schools' expectations for parental involvement are shown in Exhibit 7.4. Clearly schools expect help from parents. On average across countries, 85 percent of the students attended schools expecting parents to ensure that their children complete their homework, and 79 percent attended schools expecting parents to volunteer for school projects or field trips. About half the students were in schools expecting parents to help raise funds and to serve on committees. Only 28 percent were in schools expecting parents to help as aides in the classroom.

At the country level, in all countries with the exception of Japan, at least 60 percent of students were in schools where parents were expected to ensure that their children complete their homework. Twenty countries had at least 90 percent of their students in such schools, and in Canada and the United States almost all students (99 percent) were in such schools. The expectation that parents would serve as classroom aides was especially high in Iran, and low in Finland, Indonesia, Japan, and New Zealand. All Malaysian and Lithuanian students were in schools where parents were expected to volunteer for school projects or field trips. Raising funds was an expectation of parents for at least 75 percent of the students in Cyprus, Morocco, the Slovak Republic, South Africa, and Turkey. At least three-quarters of students were in schools where parents were expected to serve on committees in Australia, Iran, Latvia (Lss), Macedonia, Romania, South Africa, and Turkey.

Background data provided by schools.

An "r" indicates school response data available for 70-84% of students.

SOURCE: IEA Third International Mathematics and Science Study (TIMSS), 1998-1999.

¹ Serve on committees which select school personnel or review school finances.

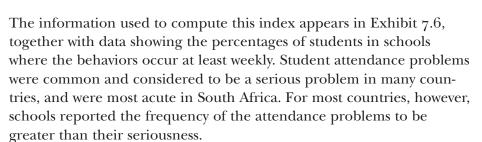

[‡] Lithuania tested the same cohort of students as other countries, but later in 1999, at the beginning of the next school year.

⁽⁾ Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

How Serious Are School Attendance Problems?

In some countries, schools are confronted with high rates of absenteeism, which can influence instructional continuity and reduce the time for learning. In general, research has shown that greater truancy is related to less serious attitudes towards school and lower academic achievement. To examine this issue, TIMSS developed an index of good school and class attendance (SCA) based on schools' responses to three questions about the seriousness of students' absenteeism, arriving late at school, and skipping class. The high index level indicates schools reported that all three behaviors are not a problem. The low level indicates that two or more are a serious problem, or two are minor problems and the third a serious problem. The medium category includes all other possible combinations of responses.

The results of the index are presented in Exhibit 7.5. Sixty percent of students on average internationally were in the medium category, where principals had judged their schools to have a moderate attendance problem. Exactly one-fifth of the students were in schools at the high level of the index, and another 19 percent were in schools at the low index level.

Index of Good School and Class Attendance

Index based on schools' responses to three questions about the seriousness of attendance problems in school: arriving late at school; absenteeism; skipping class (see exhibit 7.6). High level indicates that all three behaviors are reported to be not a problem. Low level indicates that two or more behaviors are reported to be a serious problem, or two behaviors are reported to be minor problems and the third a serious problem. Medium level includes all other possible combinations of responses.

Chapter — (1)—(2)—(3)—(4)—(5)—(6)—

Lithuania tested the same cohort of students as other countries, but later in 1999, at the beginning of the next school year.

Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.

How Safe and Orderly Are Schools?

The frequency and seriousness of student behavior threatening an orderly school environment are presented in Exhibit 7.7. The three behaviors are violating the dress code, creating a classroom disturbance, and cheating. Violation of dress code is likely to reflect, at least partially, whether there is a uniform requirement. For many countries, violating the dress code was not reported to be a serious problem, and on average internationally only six percent of the students were in schools where it was a serious problem.

In contrast, 13 percent of the students, on average internationally, were in schools that reported classroom disturbances to be a serious problem. Most countries showed a pattern in which a larger percentage of students were in schools where classroom disturbances occurred at least weekly compared with the percentage of students in schools where it was considered a serious problem. The single exception was Japan, where just five percent of the students were in schools in which classroom disturbances occurred weekly, and yet 23 percent were in schools that considered classroom disturbances to be a serious problem.

The frequency and seriousness of student behavior threatening a safe school environment are shown in Exhibit 7.8. The five behaviors are vandalism, theft, physical injury to other students, intimidation or verbal abuse of other students, and intimidation or verbal abuse of teachers or staff. As in other reports of student behavior, cross-national comparisons are difficult because of differing perceptions of what constitutes a serious problem. However, with only a few exceptions, the overwhelming majority of students attend schools judged to have few serious problems. The incidence of these student behaviors was generally low in most countries. The exception was intimidation or verbal abuse of other students, for which several countries had relatively high percentages of students in schools where the behavior occurs at least weekly; in Australia, Israel, the Netherlands, and the United States, close to half of the students were in such schools.

Frequency and Seriousness of Student Behavior Threatening an **Orderly School Environment**

Background data provided by schools

A dash (-) indicates data are not available

An "r" indicates school response data available for 70-84% of students. An "s" indicates school response data available for 50-69% of students

Chapter

244

Lithuania tested the same cohort of students as other countries, but later in 1999, at the beginning of the next school year.

⁽⁾ Standard errors appear in parentheses. Because results are rounded to the nearest whole number, some totals may appear inconsistent.
